MINNESOTA

CORN PRODUCTION IN MINNESOTA, 1928-1939
By Counties

There are many who do not realize that Minnesota is one of the major States in the production of corn; this, no doubt, is on account of its location. However, in production Minnesota usually ranks from fourth to fifth in the United States. Its corn area is gradually moving northward and the better methods of cultivation and use of hybrid varieties of seed have increased very rapidly the past few years.

In the 12-year period 1928-1939, for which county estimates have been made, for this publication, there has been a range in acres planted from 4,216,000 acres in 1928 to 4,945,000 in 1932; the 12-year average being 4,630,000 acres. If this 12-year period is divided into 6-year periods - 1928-33 and 1934-39 - a slight reduction in acreage planted is indicated. For the first period - 1928-33 - the 6-year average is 4,633,000 acres, compared with the 1934-39 average of 4,627,000 acres. When comparisons for these same 6-year periods are made for total average production and average acre yield it is found that there is a slight increase, both in production and average acre yield in the 1934-39 period over the 1928-33 6-year average. The 1928-33 average production was 143,106,000 bushels and acre yield 30.9 bushels, while for the 1934-39 period, the 6-year average production was 144,525,000 bushels and average acre yield 31.2 bushels.

In the 1928-33 period the range in production was not great, being from 107,712,000 bushels in 1931 to 178,020,000 bushels in 1932. In the 1934-39 period the range was very much greater as in 1936 the production was only 88,331,000 bushels, while in 1939 the production reached an all time record of 204,796,000 bushels with an acreage change of 148,000 acres lower in 1939 than in 1936. This forcibly illustrates the importance of weather in corn production.

The bases for these county estimates were the State farm census, the U. S. Census for 1930 and 1935, together with individual crop reports and rural carrier surveys.
